

NLP Experiences, Cisco Ready

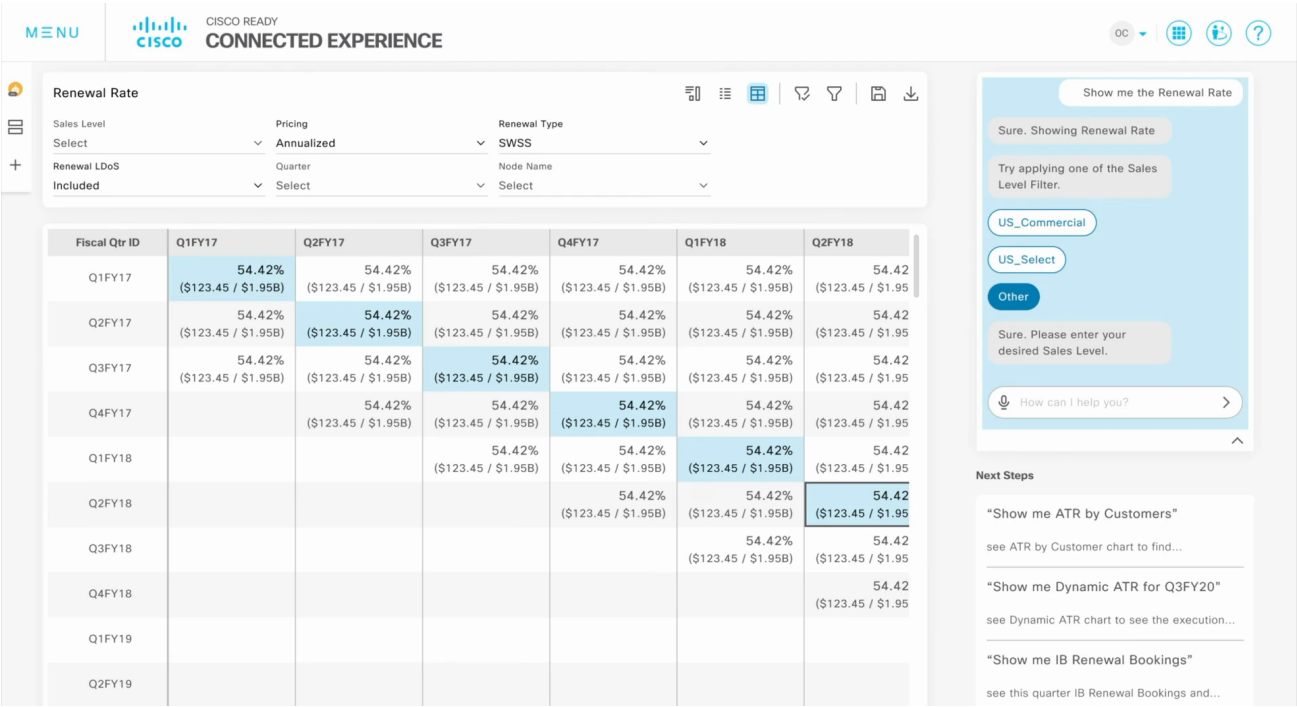

Source: [/gallery](#)

Year: 2019

As part of exploring the next phase of Cisco Ready, I designed speculative interaction models for combining natural-language input with conventional graphical interfaces built around pointing, clicking, and direct manipulation.

The prototype examined how users could use language to disambiguate intent or narrow a task, while retaining precise control through the interface whenever direct interaction was more efficient or reliable. The goal was not to replace the GUI with conversation, but to define how the two interaction modalities could hand off to one another within the same workflow.

Because this work predated generative AI, I used Google Actions as the conversational framework for prototyping these behaviors.
