

Wexel, Premera Blue Cross

Source: [/#gallery](#)

Year: 2018

Wexel was an app designed to offer flexible booking options for caretakers.

To resolve a design problem, I went through 20 iterations, tested each one with real participants, and watched them try to 'click the right button'.

It's easy to take this as standard practice, but to a former architect, the ability to validate an idea with real users without actually building anything was like finding the ultimate cheat code in the most exciting game ever built.

I already have a doctor, I just can't find the time to see her.

- caregiver to her father.

It's just hard to find a doctor quickly. I usually have to wait for a few of weeks in a row.

- caregiver to his older brother.

Overview of our Ideation and Downselection process.

Trying to think broadly and ideating 90+ different concept sketches.

Filtering 20 potential concepts based on feedback from our stakeholders.

Downselecting 3 concepts based on our evaluation matrix.

Selecting one main concept by evaluating user experience through storyboarding.
