

Structure isn't neutral — it's a lens that includes some things and filters others. In ambiguity, framing too soon can flatten insight, but framing too late can paralyze motion.

- On-demand structure honors emergent discovery, waiting until the user signals a need for scaffolding.
- Structure-first invites early alignment, letting frameworks channel thinking even in the absence of full data.

This is a tension between **exploratory fluidity** and **cognitive anchoring**.

Great strategists often oscillate between the two, knowing when to invite structure, and when to defer it, and AI should be fluent in both rhythms.
