

INSIGHT - 02

Leaders acknowledge AI Accelerates Strategic Insight Generation, Yet Sensitive Data Constraints Limit Depth.

THEME - 03

Respondents show openness to using GenAI for certain supportive, non-critical tasks, particularly around research, synthesis, and initial ideation.

"I am not skeptical at all that a generative model would be able to produce blind spots for us, but I am fully skeptical that it would be able to de-noise that list of blind spots."

- Tim

"I've become completely addicted to ChatGPT. It's like, I call it my summer intern."

- Karen

THEME - 04

Leaders express caution regarding proprietary or sensitive internal information being shared with generative AI platforms.

"I don't really want to see the person saying, hey, ChatGPT, here's the roadmap that I came up with. You now generate the blind spots... you're giving it an artifact that is proprietary to Squarespace, and you're saying analyze this artifact—that's a little bit less okay."

- Tim

"My first reaction would be hesitation... I want to make sure that if we are using an application like that and inputting or imputing our own proprietary data to any degree, that there's no compliance concerns internally."

- Akhil
