

INSIGHT - 03

Executives Emphasize Human Judgment as Irreplaceable, Yet Increasingly Delegate Critical Early-stage Thinking to AI

THEME - 05

Executives uniformly emphasize that despite GenAI's analytical capabilities, strategic judgment and contextual decision-making ultimately remain firmly in the human domain.

"[AI is good] from a research and diligence perspective... but the practicality of understanding the realities of the business and capabilities and the way resources are deployed, and strategy of the company at a single point in time, like that's impossible to layer, and that is just like knowledge and experience, and so can't ever fully replace it."

– Akhil

"AI gives output; judgment is still required... We must challenge the outputs of AI. So I think that's a basic requirement of anyone in my position."

– Dennis

THEME - 06

Leaders clearly define acceptable and unacceptable uses for GenAI, generally favoring tasks such as research, first drafts, and creative output, while categorically excluding mission-critical decisions or strategic framing.

"There's probably three different ways we can think about how tools get employed... We don't do that [strategic raw data use] very often... The second area is as a creative partner... that's an area we use generative AI quite a bit."

– Tim

"We're doing some experimentation... having the right guardrails internally from like a compliance legal perspective to make sure we're surfacing and using that information in the right way."

– Akhil
