

INSIGHT - 04

While executives seek AI automation for analytics, they maintain human roles for stakeholder coordination, showing continued reliance on personal interaction.

THEME - 07

Respondents envisioned an AI-enabled role specifically tasked with data synthesis, insight generation, summarization, and routine analytical tasks.

"We would have an AI that I'm comfortable putting in all of my policies, procedures, risk management programs... help us identify where our risks are from audit and regulatory perspective. That type of tool if it exists would be great."

– Dennis

"Running data analysis and summarizing data to come up with key takeaways, visuals, slides, memos... we spend a lot of time doing analysis ourselves... [a role that] 10x our output by using our people to layer in situational understanding on top of synthesized data."

– Akhil

THEME - 08

A frequent idea was to create a role explicitly responsible for managing operational execution, like detailed stakeholder coordination and cross-functional alignment.

"Project management type work is something I'd delegate—how to organize people, organize a project, get decisions made, drive elements of work forward... managing cross-functional teams."

– Akhil

"[Managing] overlap, making sure everyone is coordinated... there's value that would come out of that meeting if I were in it... someone who sees interdependencies, makes connections, and shares them."

– Karen
