

The top portion of the image displays a screenshot of a cloud management dashboard. The interface is divided into several sections: a top navigation bar with 'Sort', 'Close', 'date', 'tags', and 'Filter' options; a 'Products' section listing items like 'Prisma Access' and 'Prisma SD-WAN'; a 'Recent' section showing 'Strata Cloud Manager - Overhead Reduction' and 'XIGMAD Phishing Response Playbook'; and a 'Suggestions' section with recommendations such as 'How does Strata Cloud Manager reduce operational overhead?' and 'Walk me through a Cortex XSOAR phishing playbook'. The bottom of the dashboard features a 'KINDS PER PAGE' selector set to 20.

The bottom portion of the image is a table summarizing design insights. It has three columns: 'Insight', 'Design', and 'Impact'. The table contains three rows of information, each representing a different design principle and its application in the user interface.

| Insight                                                                                                                                       | Design      | Impact                                                                 |

**Problem**

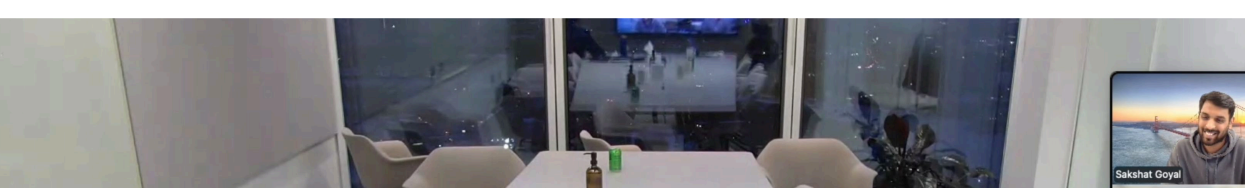

With the push to add AI experiences to platforms, there was a disconnect between AI's narrative exchanges and the structured, tactile interaction our users knew.

A FLUENCY SHAPED BY DECADES OF PRACTICE AND INDUSTRY NORMS.

THE INTERACTION PATTERN SEEN AS A NECESSITY FOR PROGRESS.

Speaking with Account teams across Americas, EMEA, and APJ/C, I found different teams having mixed opinions on the introduction of AI into their workflow.

Consistent themes included:

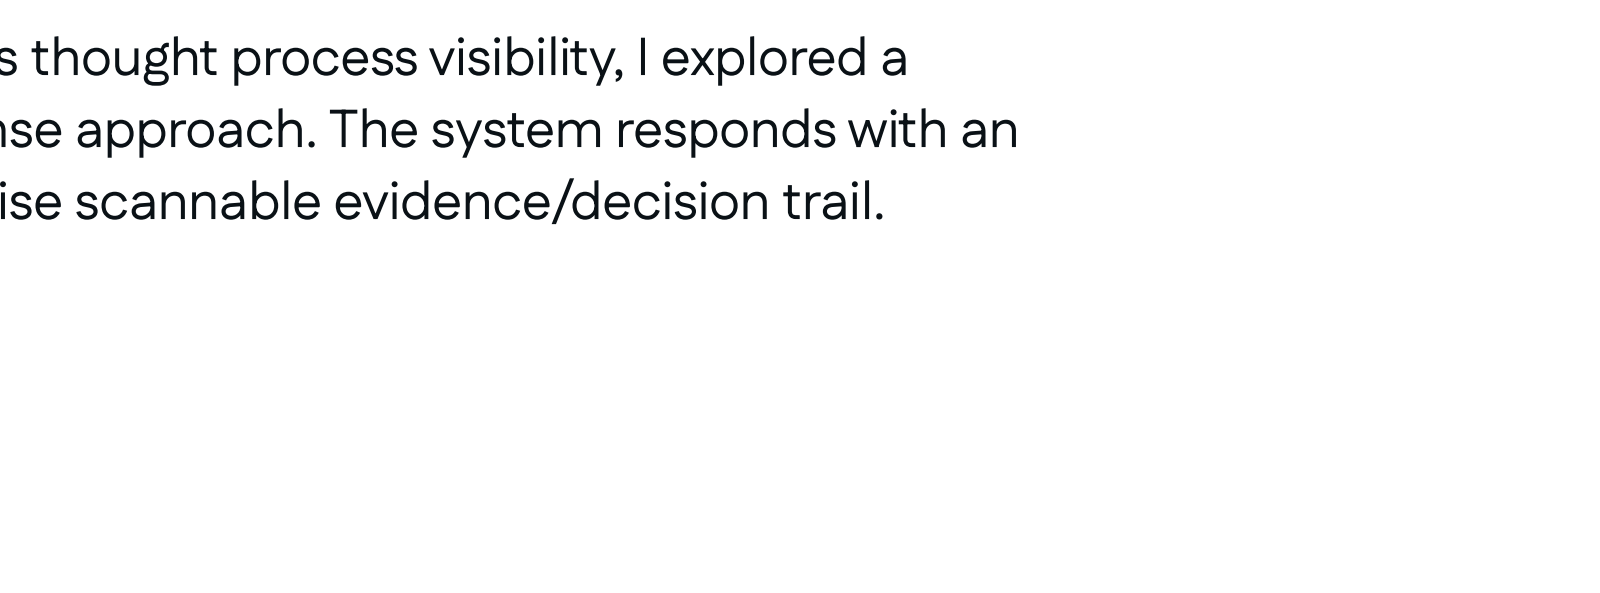

1. AI is always pitched for insights, but information workers need depth
2. It is hard to maintain focus along long chat threads.
3. Product teams consistently try to automate parts of the work that require human judgement at every step.

having to access user messages. We found our additions leading to engagement numbers over twice that of industry standard.

**25%**  
+ 12pts over industry standard

The spike in usage also gave our team the push needed to speed up data engineering activities to make more data sources available.

A typical response included a terse conclusion, a structured data-table, which combined with a clear step by step derivation made for a complete set needed to begin grounded discussions with peers.

grounded discussions with peers.

[ai-interaction][prompt-entry-field] Ease-out entrance/exit for anchored follow ups #1287

Row anchors and attachment chips require an ease-out animation when entering or exiting the prompt entry field. Currently, they appear and disappear instantly, leaving users unsure whether an action occurred.

This update applies an ease-out animation, using the same curve as a standard flyout, with a larger distance-to-rotation ratio for anchored rows and columns to emphasize the addition of anchored rows to the prompt entry field.

A screenshot of a GitHub pull request interface. At the top, it shows the repository path 'compositions/ai-interaction/prompt-entry-field.css' and a yellow 'Outdate' label. Below this, a green bar displays '36 + 3' and '2 files changed'. To the right, a status message reads 'Successfully merging this pull request may close these issues.' and '4 participants' are listed.

It was certainly uncomfortable being yet another team trying to add a chatbot with tiny chips that simulate “thinking” and treat citations as checkboxes. But acknowledging discomfort while taking action led to some

The question was never “how do we add a chatbot?” but rather “what opportunities does our product have that chatbots can improve that?”

assumptions do we carry about the chatbot experience that will fail our users?”
